

Armor - Medical Attire - As a scientist first and foremost I need sanitary, comfortable clothing that can provide me with utility storage. Armor plating will only weigh me down and a flowing robe will simply get in the way. Also, anything I wear is highly likely to get set on fire, burnt by acid or exposed to who knows what else and the medical attire is at a cost conducive to regular replacement.

Weapon - Shoto lightsaber - As an Aleena, I am used to most "off-the-shelf" items being a bit larger than ideal but in this case I can repurpose what is considered an undersized weapon for most into a rightsized weapon for myself. While many of the additional weapons could prove very useful in experiments, I need to invest in at least one item for personal safety. I focus on my lightsaber skills because I have so little time between experiments as it is that I definitely don't have the time to practice with secondary weapon skills.

Equipment - Performance Datapad - Joining the Brotherhood has been quite a boon with relation to my data collection and I need a quality device that can help me store and work through all of that information. With multiple inputs I should be able to run different devices through its computational programs to really accelerate the number crunching. Additionally, the portability factor does lend itself well to field experiments although how well it will hold up to field work remains to be seen.

Technology - Hololens - This device goes hand in hand with my datapad. In the lab it will allow me to review data hands-free and in real-time. However in the field is where this device will really shine. Even in the midst of combat I can review the data being collected and make adjustments, if needed, to acquire the appropriate data. One such example would alternating locations to measure the air temperature fluctuations caused by repeated Force power usage.

Accessory - Kyber Crystal - This is the item I am most excited about because when one contemplates possible sub-atomic connections between the Force and physical matter there are little better specimens I can think to experiment on than a Kyber crystal. As a naturally occurring object that is infused with Force energy my mind races at what mysteries lie within its atoms. It is likely that by the time I was done with it the crystal would be of little use to anyone in the construction of their lightsaber but if it allowed me to delve further into my theory it will have served a much greater purpose than merely focusing energy into a cutting tool.
