

**Item Prototype Name:** Miniaturized Kyber-Hypermatter Accelerator Reactor (AR-K) System

**Example Image:** (Courtesy of Iron Man Comics)

**Proposed Item Rarity:** Legendary/Artifact

**Proposed Item Cost:** 500,000 Credits

**Item Description:** This item is a miniaturized prototype of the experimental Kyber-Hypermatter Accelerator Reactor (ARK) System that was on a Venator-Class vessel that went down on the planet Kenari during the Clone Wars. Powered by multiple shards of kyber crystals, stabilized through very precise placement of the crystals and an array of metals capable of channeling this energy, the ARK Reactor serves as a renewable power source capable of running a capital ship for several millennia. At this small size, it's also applicable to power a suit of armor, though the high energy output would likely annihilate the armor and the person wearing it. It also bears the potential of being utilized via enhanced cybernetics to keep the humanoid brain and heart running far beyond the typical lifespan of any sentient species.
